WHAT IS CLAIMED IS:

1. A computer-based on-line skills/résumé management system, said system comprising:

a relational database having a plurality of fields wherein a portion of said fields

are arranged in a hierarchical relationship;

database population means for populating said database with information, said population means interfacing with a first user and prompting said first user for information for at least a portion of said fields arranged in said hierarchical relationship;

query generation means for interfacing with a second user and prompting said second user to select a combination of said fields in said hierarchical relationship to form at least a portion of a query for searching said database;

search means operatively connected to database for applying said query to said relational database; and

output means for providing said second user with results of said search.

- 2. The system of claim 1, wherein said database population means prompts said first user to respond to a choice of professions, prompts said first user with a choice of subcategories based upon said profession, and then prompts said first user to attribute a time duration for a particular choice of profession subcategories.
- 3. The system of claim 1, wherein said query generation means prompts said second user to select a choice of professions, prompts said second user to select a choice of subcategories based upon said profession, and then prompts said second user to specify a time requirement for a particular selection of profession subcategories.

- 5. A computer based central skill/résumé management system, said system comprising: a central processing unit (CPU) containing a database server;
 - a database operatively connected to said CPU, said database having a plurality of fields, a portion of said fields being arranged in a hierarchy and/or network relationship;
 - a user interface operatively connected to said CPU, said user interface interfacing said system with a user over a telecommunicative link;
 - memory operatively connected to said CPU, said memory containing instructional means for configuring said system to perform the following:

populating said database with information by interfacing with a first user and prompting said first user for information for at least a portion of said fields arranged in said hierarchical relationship;

formulating a query by interfacing with a second user and prompting said second user to select a combination of said fields in said hierarchical relationship to form at least a portion of a query for searching said database;

searching said database using said query; and outputing results of said search.

The system of claim 5, wherein in populating said database, the system prompts said first user to respond to a choice of professions, prompts said first user with a choice of subcategories based upon said profession, and then prompts said first user to attribute a time duration for a particular choice of profession subcategories.

- 7. The system of claim 6, wherein in formulating a query, said system selects a choice of professions, prompts said second user to select a choice of subcategories based upon said profession, and then prompts said second user to specify a time requirement for a particular selection of profession subcategories.
- 8. The system of claim 5, wherein said search means uses a select command based on said fields to select a user according to said query.
- 9. The system of claim 5, wherein said instructional means configure the system to display comparative displays of candidates.
- 10. A method of managing skills and résumés using an on-line skill/résumé management system, said system comprising a central processing unit (CPU) containing a database server, a relational database operatively connected to said CPU, said relational database having a plurality of fields, a portion of said field being arranged in a hierarchy, and a user interface operatively connected to said CPU, said user interface interfacing said system with a user over a telecommunicative link, said method comprising the steps of:

configuring a search query by using said user interface to prompt a user to select a combination of said fields in said hierarchy relationship to form at least a

5

portion of a search query;

searching said database using said query;

displaying results graphically and/or in a tabular fashion in specialized ways; and outputing results of said search.

11. The method of claim 10, further comprising:

populating said database with information by using a user interface to prompt another user for information for at least a portion of said fields arranged in said hierarchy.

12. The method of claim 11, wherein populating said database comprises:

prompting said first user to respond to a choice of professions;

prompting said first user with a choice of subcategories based upon the respective parent categories within said profession; and

prompting said user to attribute a time duration for a particular choice of profession subcategories.

13. The method of claim 10, wherein formulating a query comprises:

prompting said user to select a choice of professions;

prompting said user to select a choice of subcategories based upon their parent categories within said profession; and

prompting said user to specify a time requirement for a particular selection of profession subcategories.

- 14. The method of claim 13, wherein said relational database further includes a field of education and other fields.
- 15. The method of claim 10, wherein said process further comprises: modifying said query after outputing said results.
- 16. The method of claim 10, wherein said process further comprises: sorting said results according to said fields.
- 17. The method of claim 10, wherein said process further comprises: scheduling an interview with a candidate.
- 18. The method of claim 10, wherein said process further comprises:

 receiving an indication of availability via a telecommunicative link from a candidate.
- 19. The method of claim 10, wherein populating said database includes entering educational information and job preferences.
- 20. The method of claim 10, wherein populating said database includes agreeing to charges for said on-line résumé service.
